

1. Read and practice all sample codes from 71-Dom-Bom-JavaScript-Typescript-Node.md on your local browser or an online compiler.
2. Resolve **5** leetcode problems using Javascript.
3. Compare `let` vs `var` , explain variable hosting with your own code examples.
4. Explain `closure` with code example
5. Explain `callback Hell` with code example
6. Explain `Promise` , `Async` , `Await` with code examples.
7. Write an HTML page that generates a lucky number based on the date, time, and user inputs. Users should be able to get their random lucky numbers by clicking a button or using the enter key after typing the input.
8. Write an HTML page that returns a user's GitHub repos (https://api.github.com/users/{user_id}/repos) in JSON format. The web page should have a text box and a submit button where users can provide the GitHub user ID. The fetch call should be asynchronous. If the call to the above API fails for any reason, you should return a customized, user-friendly error message. If you know more than one approach to implement the asynchronous call, please do it using different approaches.
9. Explain how Javascript implement asynchronous non-blocking feature
 1. Particularly: Event Loop, Macrotask, and Microtask with code samples.

Please submit code, answers, and screenshots to your GitHub branch.
