

Questions

- Why is it better to use a custom exception class (e.g. `ResourceNotFoundException`) in your application?
- Explain how `@Table`, `@Column`, and `@Id` work. What is the default behavior if you don't use them?
- What happens if you don't annotate a class with `@Entity`, but still try to save it with JPA?
- What happens if we forget to annotate a controller with `@RestController` and only use `@RequestMapping`?
- What is the default naming strategy of JPA for tables and columns when no explicit name is given?
- How does `@PathVariable` differ from `@RequestParam`?

Write answers in your mark down file.

Hands on:

- Write a method in a repository to find all posts with the title containing a certain keyword. (Create some test posts if necessary)

share screen shots in your mark down file.
